Surreal numbers

└ Introduction : Numbers

└ Outline

Numbers

- Construction of numbers : $\emptyset \rightarrow \mathbb{N} \rightarrow \mathbb{Q} \rightarrow \mathbb{R}$
- \mathbb{R} is the unique Archimedean and complete field.

2019-11-26

Surreal numbers

└ Introduction : Numbers

└ Numbers

- Construction of numbers : $\emptyset \rightarrow \mathbb{N} \rightarrow \mathbb{Q} \rightarrow \mathbb{R}$
- \mathbb{R} is the unique Archimedean and complete field.

- If we want to talk about surreal numbers, the very first thing to wonder what is a number. In classical set theory we start from the emptyset and build numbers, then rational numbers and finally with Cauchy-completion or Dedekind-completion.
- \mathbb{R} is the unique field that is both Archimedean and complete. This properties are fundamental to prove fundamental theorems of analysis (TVE, TVI, Rolle, Mean Value Theorem, Fixed Point Theorems).

Numbers

- Construction of numbers : $\emptyset \rightarrow \mathbb{N} \rightarrow \mathbb{Q} \rightarrow \mathbb{R}$
- \mathbb{R} is the unique Archimedean and complete field.
- What about replace \mathbb{N} by a set of ordinal number ?

$$\text{Normal form : } \sum_{i < \alpha} n_i \omega^{\alpha_i}$$

Get **surreal numbers**.

2019-11-26

Surreal numbers

└ Introduction : Numbers

└ Numbers

- If we want to talk about surreal numbers, the very first thing to wonder what is a number. In classical set theory we start from the emptyset and build numbers, then rationnal numbers and finally with Cauchy-completion or Dedekind-completion.
- \mathbb{R} is the unique field that is both Archimedean and complete. This properties and fundamental to prove fundamental theorems of analysis (TVE, TVI, Rolle, Mean Value Theorem, Fixed Point Theorems).
- With ordinal number instead of natural numbers we may get other things. We may get a lot of new numbers, that may look like the normal form of ordinal theorems.

Inductive definitions

Theorem (Conway)

If $L < R$ are two subsets of the surreal numbers then there is a unique x with minimum length such that $L < x < R$

Ok, now we know how surreal numbers are built but now what about operations? If we speak about numbers, we need addition, multiplication... First we have a theorem by Conway that enable us to build the surreal numbers.

Inductive definitions

Theorem (Conway)

If $L < R$ are two subsets of the surreal numbers then there is a unique x with minimum length such that $L < x < R$

- Canonical Conway-representation : $x = [L_x \mid R_x]$ with

$$L_x = \{y \triangleleft x \mid y < x\} \quad \text{and} \quad R_x = \{y \triangleleft x \mid y > x\}$$

Surreal operations : Multiplication

Definition

$$x \times y = \left[\begin{array}{l} l_x y + x l_y - l_x l_y \\ r_x y + x r_y - r_x r_y \end{array} \middle| \begin{array}{l} l_x y + x r_y - l_x r_y \\ r_x y + x l_y - r_x l_y \end{array} \right]$$

$$x \times y = \left[\begin{array}{l} l_x y + x l_y - l_x l_y \\ r_x y + x r_y - r_x r_y \end{array} \middle| \begin{array}{l} l_x y + x r_y - l_x r_y \\ r_x y + x l_y - r_x l_y \end{array} \right]$$

Definition de \times

Surreal operations : Multiplication

Definition

$$x \times y = \left[\begin{array}{l} l_x y + x l_y - l_x l_y \\ r_x y + x r_y - r_x r_y \end{array} \middle| \begin{array}{l} l_x y + x r_y - l_x r_y \\ r_x y + x l_y - r_x l_y \end{array} \right]$$

Proposition

- *Multiplication has the uniformity property*
- $(\mathbf{No}_{<}, +, \times)$ is field.

$$x \times y = \left[\begin{array}{l} l_x y + x l_y - l_x l_y \\ r_x y + x r_y - r_x r_y \end{array} \middle| \begin{array}{l} l_x y + x r_y - l_x r_y \\ r_x y + x l_y - r_x l_y \end{array} \right]$$

- *Multiplication has the uniformity property*
- $(\mathbf{No}_{<}, +, \times)$ is field.

Definition de \times

Surreal operations : Inverse

Proposition

Let $x = [L_x \mid R_x]$ in the canonical representation. Then $\frac{1}{x}$ is defined as follows.

- $\langle \rangle = 0$
- For $y_0, \dots, y_n \in (L_x \cup R_x) \setminus \{0\}$,

$$\langle y_0, \dots, y_n \rangle = \frac{1 - (x - y_n) \langle y_0, \dots, y_{n-1} \rangle}{y_n}$$

$$\begin{cases} L_{1/x} = \{ \langle y_0, \dots, y_n \rangle \mid |\{i \mid y_i \in L_x\}| \in 2\mathbb{N} \} \\ R_{1/x} = \{ \langle y_0, \dots, y_n \rangle \mid |\{i \mid y_i \in L_x\}| \in 2\mathbb{N} + 1 \} \end{cases}$$

Then
$$\frac{1}{x} = [L_{1/x} \mid R_{1/x}]$$

And the definition has the uniformity property.

- $\langle \rangle = 0$
- For $y_0, \dots, y_n \in (L_x \cup R_x) \setminus \{0\}$,

$$\langle y_0, \dots, y_n \rangle = \frac{1 - (x - y_n) \langle y_0, \dots, y_{n-1} \rangle}{y_n}$$

$$\begin{cases} L_{1/x} = \{ \langle y_0, \dots, y_n \rangle \mid |\{i \mid y_i \in L_x\}| \in 2\mathbb{N} \} \\ R_{1/x} = \{ \langle y_0, \dots, y_n \rangle \mid |\{i \mid y_i \in L_x\}| \in 2\mathbb{N} + 1 \} \end{cases}$$

Then
$$\frac{1}{x} = [L_{1/x} \mid R_{1/x}]$$

And the definition has the uniformity property.

Surreal numbers of bounded length

Notation $\mathbf{No}_{<\alpha} = \{x \in \mathbf{No} \mid \text{length}(x) < \alpha\}$

- So far we were interested in the whole class of surreal numbers. But there are sub-structures that may be interesting. Typically, what about the set of surreal numbers of bounded length (or birthday).
- The very first question is, what are the conditions on α so that we have usual algebraic structures.

Surreal numbers of bounded length

Notation

$$\mathbf{No}_{<\alpha} = \{x \in \mathbf{No} \mid \text{length}(x) < \alpha\}$$

Proposition (Van den Dries and Ehrlich [8], corollaries 3.1, 4.4 and 4.9)

$\mathbf{No}_{<\lambda}$ is

- an additive group iff λ is additive (i.e. has form $\lambda = \omega^\alpha$ for some ordinal α)
- is a ring iff λ is multiplicative (i.e. has form $\lambda = \omega^{\omega^\alpha}$ for some ordinal α)
- is a field iff λ is an ε -number (i.e. satisfies $\lambda = \omega^\lambda$)

└ Interlude : Hahn series

$$\left\{ \sum_{\gamma \in \Gamma} r_\gamma t^\gamma \mid r_\gamma \in \mathbb{K}, \text{supp}(x) := \{\gamma \mid r_\gamma \neq 0\} \text{ is well ordered} \right\}$$

So far we have seen the the two first definition of the surreal numbers. What about the third one?

- We first define Hahn series.
- This is an ordered field

Interlude : Hahn series

Definition (Hahn series field)

Let \mathbb{K} be a field and Γ an Abelian ordered group. The associated formal power series field denoted $\mathbb{K}((t^\Gamma))$ is

$$\left\{ \sum_{\gamma \in \Gamma} r_\gamma t^\gamma \mid r_\gamma \in \mathbb{K}, \text{supp}(x) := \{\gamma \mid r_\gamma \neq 0\} \text{ is well ordered} \right\}$$

This field admits a natural notion of order, the lexicographical order.

Theorem (Gonshor, [6])

Every x in \mathbf{No} can be written in a unique way as $x = \sum_{i < \alpha} r_i \omega^{a_i}$

with $r_i \in \mathbb{R}$ and the $a_i \in \mathbf{No}$ decreasing and $\mathbf{No} \simeq \mathbb{R}((t^{\mathbf{No}}))$ (ordered fields isomorphism).

$$\left\{ \sum_{\gamma \in \Gamma} r_\gamma t^\gamma \mid r_\gamma \in \mathbb{K}, \text{supp}(x) := \{\gamma \mid r_\gamma \neq 0\} \text{ is well ordered} \right\}$$

This field admits a natural notion of order, the lexicographical order.

Every x in \mathbf{No} can be written in a unique way as $x = \sum_{i < \alpha} r_i \omega^{a_i}$ with $r_i \in \mathbb{R}$ and the $a_i \in \mathbf{No}$ decreasing and $\mathbf{No} \simeq \mathbb{R}((t^{\mathbf{No}}))$ (ordered fields isomorphism).

So far we have seen the the two first definition of the surreal numbers. What about the third one ?

- We first define Hahn series.
- This is an ordered field
- We have a very good isomorphism that links the sign expansions and the Hahn series. Moreover the the sign expansion can be "easily" deduced from the Hahn series. Finally the Hahn series of ordinal number seen as surreal numbers are their normal forms as usual ordinals.

Sub-fields from Hahn series

Theorem (Alling [1], Van den Dries, Ehrlich [8])

Let \mathbb{K} be real-closed and Γ divisible. Let λ be an ε -number.

Then

$\mathbb{K}_\lambda^\Gamma := \left\{ x \in \mathbb{K}((t^\Gamma)) \mid \text{supp } x \text{ has order type lower than } \lambda \right\}$
is a real-closed field.

For $(a_i)_i$ not coinital $\sum_{i<\lambda} r_i \omega^{a_i}$ (Type 1)

For $x \in \widetilde{\mathbb{R}}_\lambda^\mu$ and \mathcal{G} a gap of $\mathbf{No}_{<\mu}$ $x + \omega^{\mathcal{G}}$ (Type 2)

2019-11-26

Surreal numbers

└ Computations with surreal numbers, existing methods

└ Cauchy completion

└ Cauchy cuts and Cauchy completion

Cauchy cuts and Cauchy completion

\mathbb{R} is Cauchy-complete iff it has no non-trivial Cauchy gap.

$\mathbb{R}_\lambda^\mu := \mathbb{R}_\lambda^{\mathbf{No}_{<\mu}}$ has a simple Cauchy-completion.

Proposition

The Cauchy-completion of \mathbb{R}_λ^μ is

$$\widetilde{\mathbb{R}}_\lambda^\mu = \mathbb{R}_\lambda^\mu \cup \left\{ \sum_{i<\lambda} r_i \omega^{a_i} \mid r_i \in \mathbb{R}, a_i \in \mathbf{No}_{<\mu} \text{ are coinital} \right\}$$

Proposition

Non-trivial gaps in $\widetilde{\mathbb{R}}_\lambda^\mu$ may be of the form :

For $(a_i)_i$ not coinital $\sum_{i<\lambda} r_i \omega^{a_i}$ (Type 1)

For $x \in \widetilde{\mathbb{R}}_\lambda^\mu$ and \mathcal{G} a gap of $\mathbf{No}_{<\mu}$ $x + \omega^{\mathcal{G}}$ (Type 2)

- If we speak about Cauchy gap, it is because we can avoid them. In particular we can have a complete field. The difference with a real case being that the sequence must have length the degree of the field, which is the coinitality of the set of positive elements of the field.
- Def : Coinital, Cofinal, Coinitality, Cofinality.
- With Hahn series, we have a nice Cauchy completion
- The remaining gaps are exactly what we expect. In particular, in type 1 gaps we just get rid of the case where the (a_i) s are coinital.

Motivation for Cauchy-completion

Cauchy-completion is less powerful than Dedekind-completion (no non-trivial gap remaining).

- └ Computations with surreal numbers, existing methods
 - └ Cauchy completion
 - └ Motivation for Cauchy-completion

Cauchy-completion and Dedekind-completion are different. It is because the field is not Archimedean. Dedekind-completion is much more powerful. So we have to give a motivation for the use of Cauchy-completion. **Voir slide : bonne propriétés**

Dedekind completion would introduce new elements that are even not surreal number (such as ∞). Of course you may say there are surreal numbers that are not the considered field and that would be able to play the role of ∞ . But adding them create even more gaps because you want to get a field at the end !

Motivation for Cauchy-completion

Cauchy-completion is less powerful than Dedekind-completion (no non-trivial gap remaining). Many gaps remain in $\widetilde{\mathbb{R}}_{\lambda}^{\mu}$ so why a Cauchy-completion ?

Theorem
 (λ, μ) -strongly-compact set the subsets $X \subseteq \widetilde{\mathbb{R}}_\lambda^\mu$ such that one of the following is true

- X is closed and for any $Y \subseteq X$ such that $\sup Y$ (resp. $\inf Y$) is a gap, there is $Z \subseteq X$ such that $\inf Z = \sup Y$ (resp. $\sup Z = \inf Y$)
- Every covering no-gap-showing \mathcal{X} of X by open sets admits a finite sub-covering.

With open sets : open sets are union of (strongly)-disjoint open intervals.
 You have to consider the bounds of such intervals to say that a covering is or not gap-showing.

Alternative definitions

Theorem

(λ, μ) -strongly-compact set the subsets $X \subseteq \widetilde{\mathbb{R}}_{\lambda}^{\mu}$ such that one of the following is true

- X is closed and for any $Y \subseteq X$ such that $\sup Y$ (resp. $\inf Y$) is a gap, there is $Z \subseteq X$ such that $\inf Z = \sup Y$ (resp. $\sup Z = \inf Y$)
- Every covering no-gap-showing \mathcal{X} of X by open sets admits a finite sub-covering.
- Gaps $[L \mid R]$ are allowed if there is $Y \in \mathcal{X}$ and $I \subseteq Y$ an open interval such that $\inf I < [L \mid R] < \sup I$

Strongly continuous functions

Definition

A function $f : \widetilde{\mathbb{R}}_\lambda^\mu \rightarrow \widetilde{\mathbb{R}}_\lambda^\mu$ is said to be (λ, μ) -strongly-continuous if it is continuous and for any non-trivial gap $G = [L \mid R]$ of $\widetilde{\mathbb{R}}_\lambda^\mu$ either f has a limit in G that is reached on any neighborhood of G or there is a non-trivial gap $H = [A \mid B]$ such that for any neighborhood J of H there is a neighborhood I of G such that

$$x \in I \implies f(x) \in J$$

$$f(I) \cap]H; \sup J[\neq \emptyset \quad \text{and} \quad f(I) \cap]\inf J; H[\neq \emptyset$$

Basic analysis of strongly continuous functions

Proposition (Intermediate value theorem)

Let $f : \widetilde{\mathbb{R}}_{\lambda}^{\mu} \rightarrow \widetilde{\mathbb{R}}_{\lambda}^{\mu}$ be (λ, μ) -strongly-continuous . Assume $f(a) \leq f(b)$. Then for all $y \in [\min(f(a), f(b)); \max(f(a), f(b))]$ there is $a \leq c \leq b$ such that $f(c) = y$.

Theorem (Extreme Value Theorem)

Let $f : \widetilde{\mathbb{R}}_{\lambda}^{\mu} \rightarrow \widetilde{\mathbb{R}}_{\lambda}^{\mu}$ be a (λ, μ) -strongly-continuous function. Let $X \subseteq \widetilde{\mathbb{R}}_{\lambda}^{\mu}$ be a (λ, μ) -strongly-compact set, then $f(X)$ is also (λ, μ) -strongly-compact . In particular, it has a maximum and a minimum on X .

Suitable restricted set theory

2019-11-26

Surreal numbers

└ Problem of integration

└ Perspectives

└ Suitable restricted set theory

Idea

Gaps are "very" outside the surreal fields.

If we consider a suitable (with notions of constructivism) set theory (something like what is introduced in Barwise, [2]), strongly compact sets may be the actual compact sets and strongly continuous functions, the continuous function.
